# Quick Print

## Introduction

Quick Print is a handy program that allows you to print in an easy and quick way.

It prints the Finder's selected items without opening the native application and prints the Clipboard.

Currently it supports most of the common images, text files, web browser files, PDFs, fonts, content of folders, applications and many more. When a non supported file kind is selected, it shows the Quick Look preview image that can also be printed.

Figure 1: Quick Print window.

## How to use Quick Print

To print an item you only need to select it in the Finder; if the Quick Print window is closed, click on its icon on the menu bar, then click on the print button.

Figure 2: Attached Quick Print window with no item to print selected.

To open the window you have to click on the Quick Print icon (red circle in figure 2) on the menu bar, or type the hot key (^ ⌘ P by default); you can also drag the item to print on the Quick Print icon, or use the system Service (see figure 3) available from the Finder and from all the applications whose selected information can be used by Quick Print.

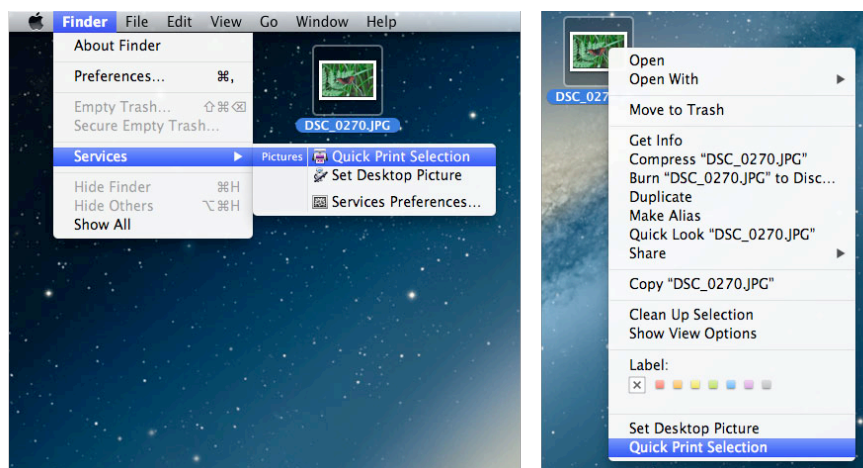

Figure 3: System Service to open Quick Print.

## How to print the Clipboard

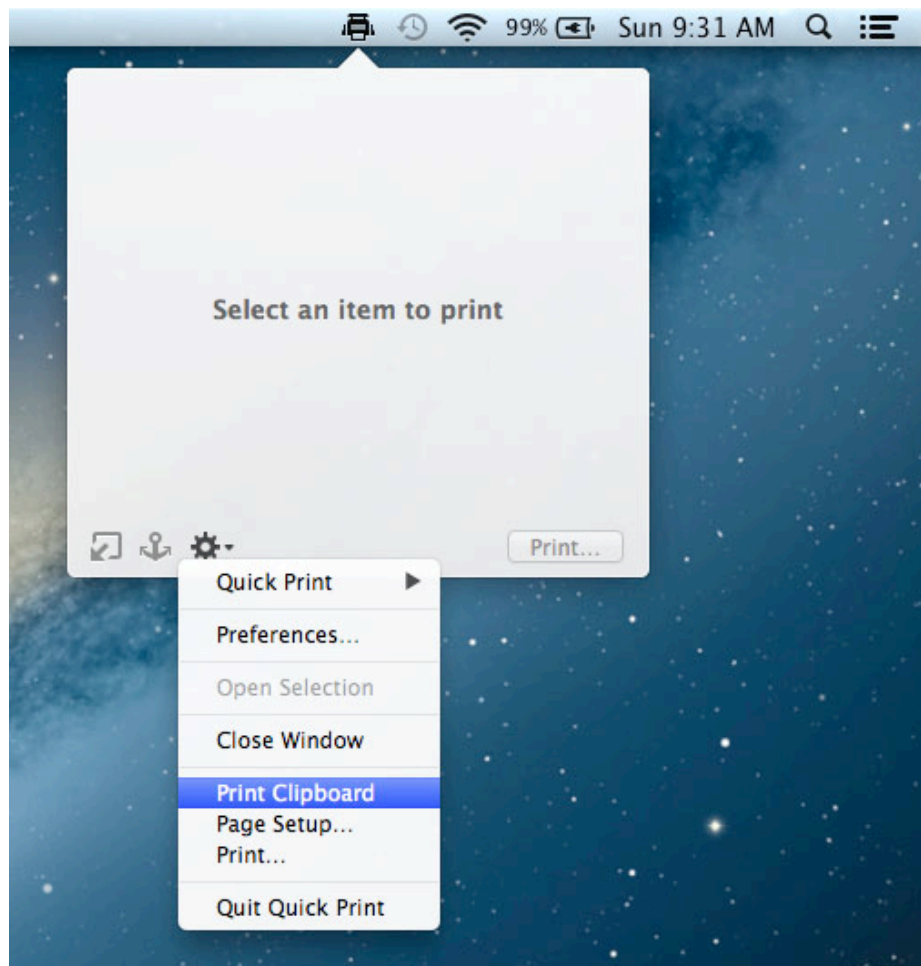

Figure 4: Actions menu.

To print the data copied to the clipboard, just choose the Print Clipboard menu item from the Actions menu.

## Interface details

### Common controls

Common controls are application-dependent and are visible at all time.

Detach button, allows you to detach the window from the menu bar.  
Note that it's possible to detach the window by clicking on the window background.

Attach button, it is visible once the window is detached and allows you to re-attach the window.

Anchor button, it's visible only when needed and, when selected, allows you to keep the window open when a click on the desktop is made and no selected file was found.

Actions menu, allows you to accomplish the main actions related to the application, such as opening the preferences window, quitting Quick Print, etc.

Info button, it is visible only when an item to print is showed and allows you to see and print the main attributes of that item.

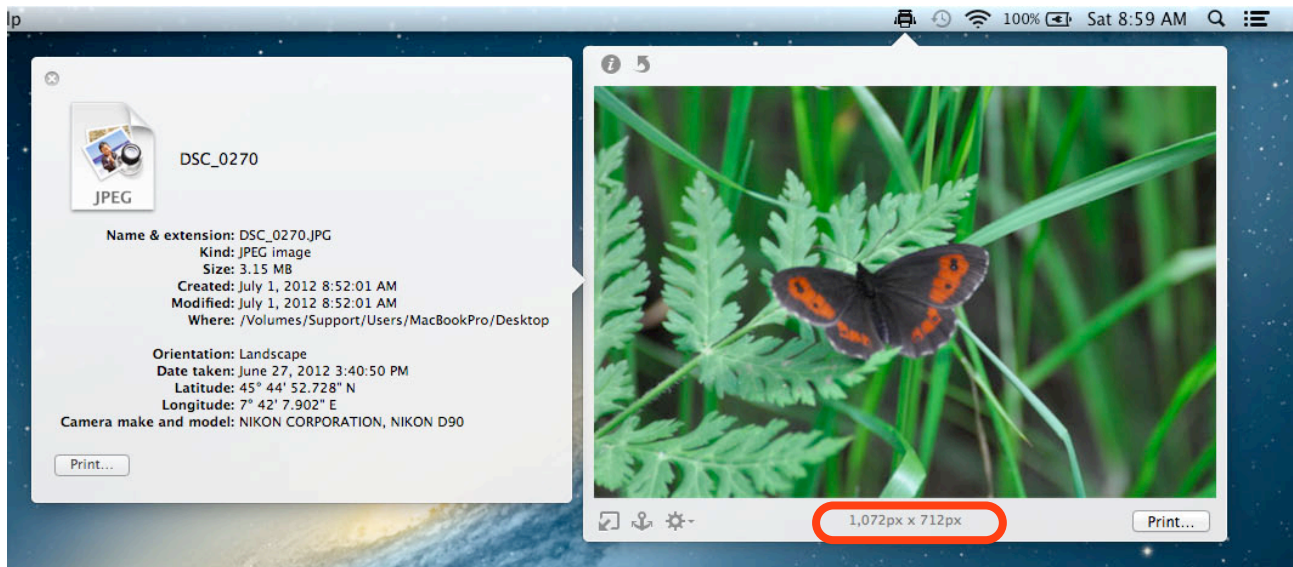

Figure 5: Image to print with the info window that shows the attributes to be printed.

## Images controls

Rotate left button, allows you to rotate the image to the left.

If you hold down the option key, it allows you to rotate the image to the right.

Clicking on the dimension field (red circled in the image above), it's possible to change the size units.

If you double-click on the image, the standard "Image Edit" panel will be shown, allowing you to apply image filters before printing it.

## Application controls

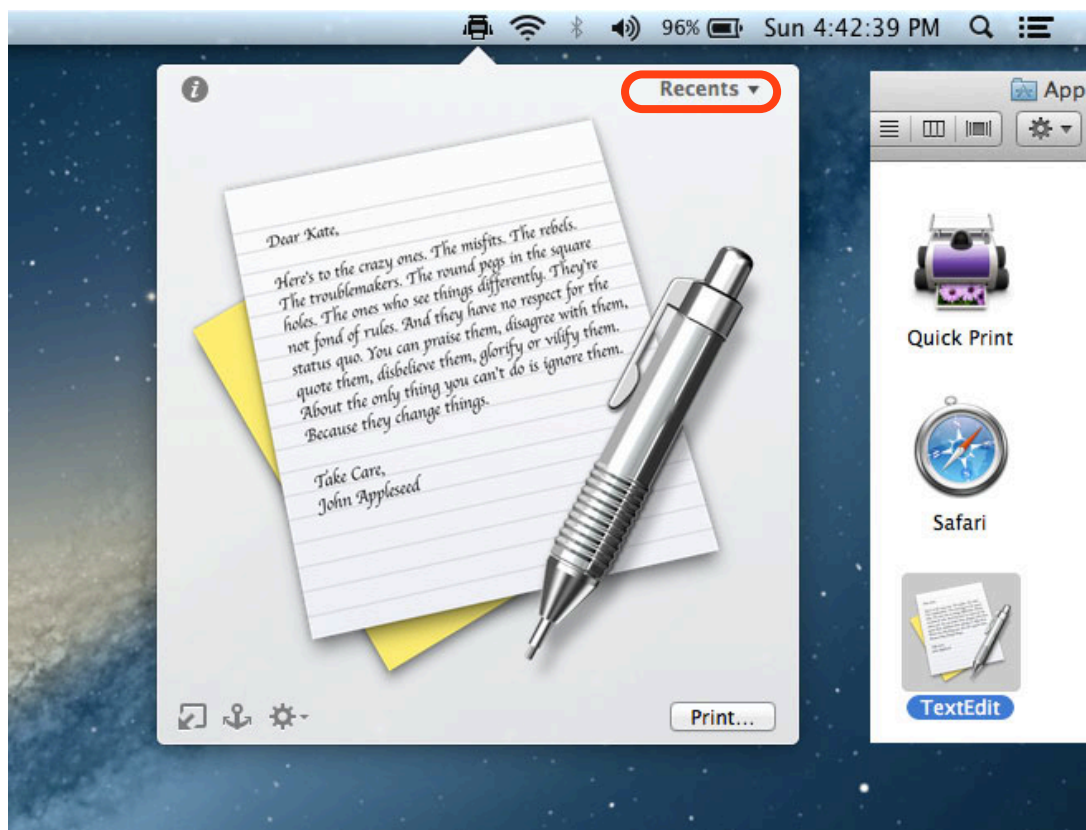

Figure 6: TextEdit application selected.

When an application is selected and the recent items are stored using the OS X system, Quick Print shows a menu (red circled in the figure 6) that contains the recent documents managed by that application. If those documents are in a format supported by Quick Print, you can print those files without opening them in the native app.

## Folder controls

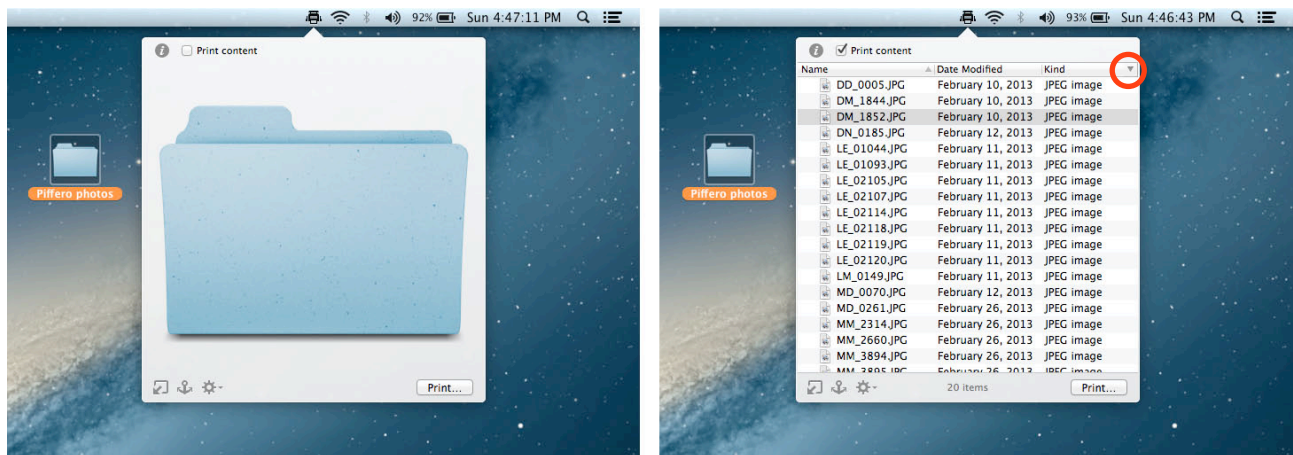

Figure 7: Folder icon and its content.

If a folder, a smart folder or a hard drive is selected, Quick Print gives you two possibilities: you can either print the icon or the folder(or hard drive)'s content as a list. The content is visible only if the "Print content" check button is ticked. You can customize the list's view by clicking on the menu represented by a down-oriented triangle at the right side of the list, red circled in the figure 7.

## Text and font controls

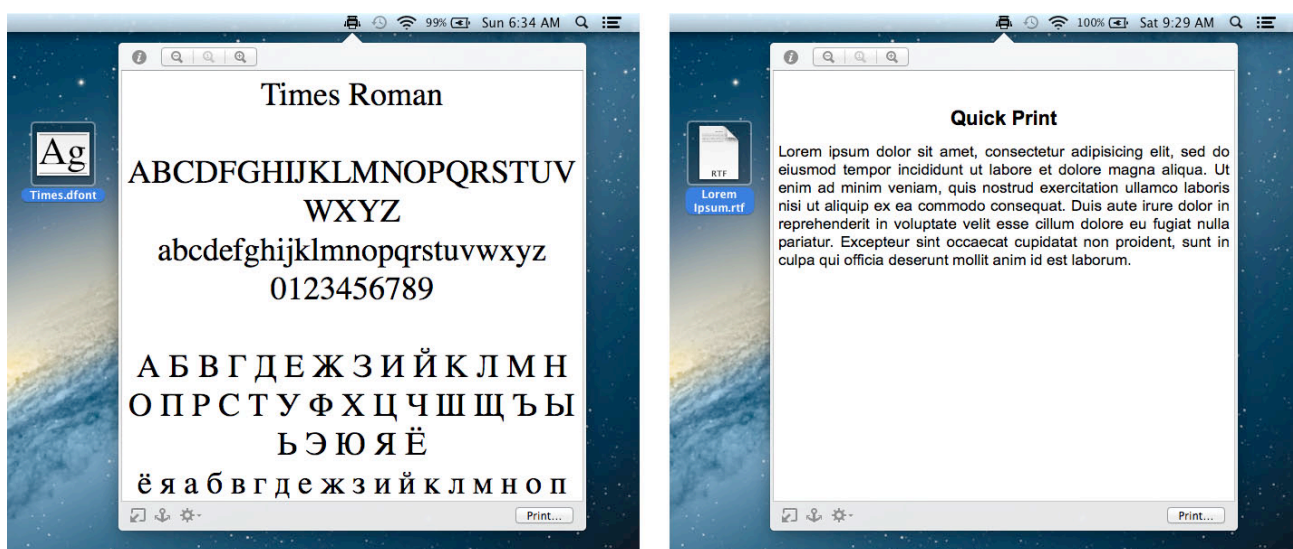

Figure 8: Font and text file to be printed.

Scale the font size down

Scale the font size up

Display the document in the initial size.

Using the above buttons allows you to print the document in the size you have set.

## PDF controls

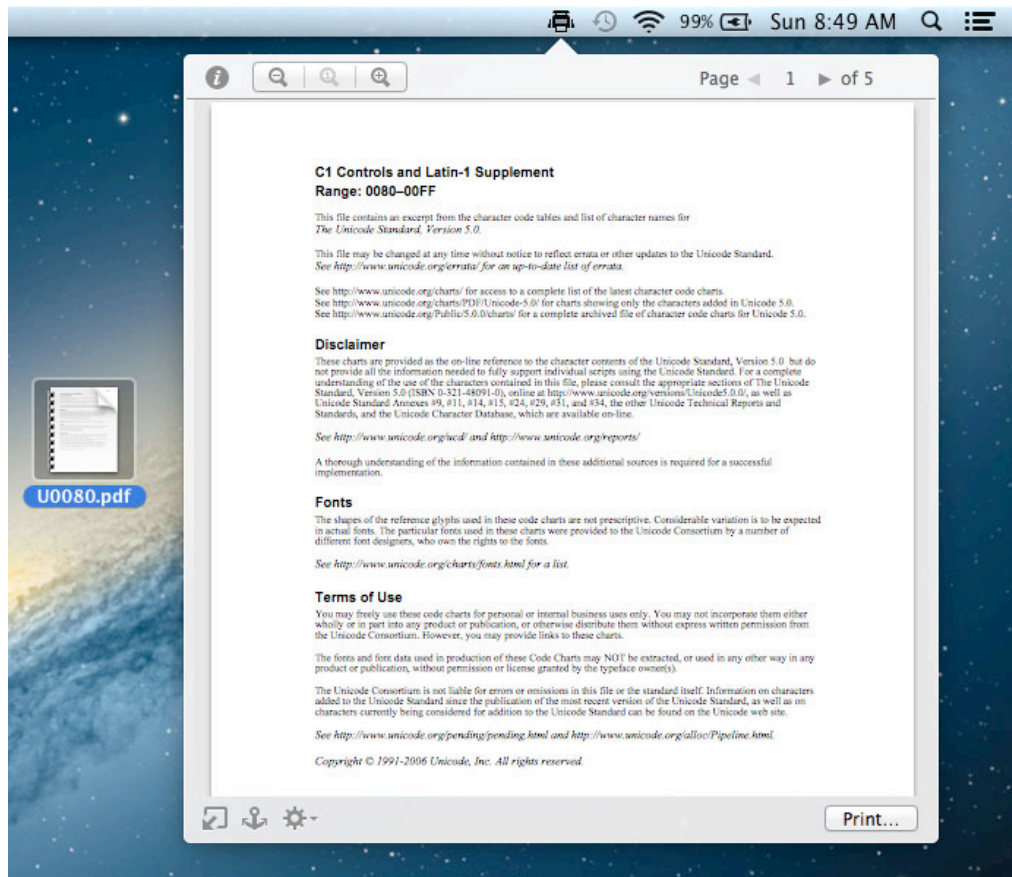

Figure 9: PDF file to be printed.

As the text view, the PDF view has the zoom document controls. In addition, it shows the navigation controls, which allow you to jump to a specific page number or browse the pages by clicking on the arrow buttons.

## Web browser file controls

Figure 10: Web browser file to be printed.

Contains the navigation buttons, and the stop button.

## Known bugs

1- When a new finder window is created the Finder doesn't recognize that the front most window has changed and, if an item is selected in the new window, it doesn't report the correct selection. For further info you can take a look here <http://www.openradar.me/9406282>

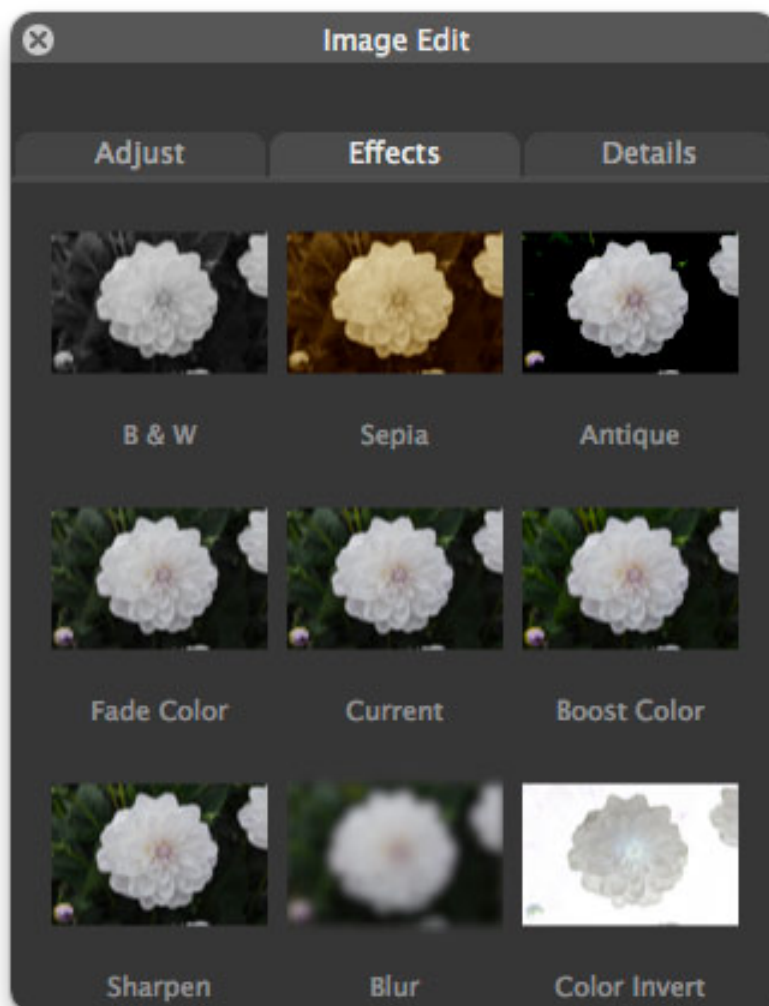

Workaround:

To have Quick Print show a selected item in the new window, you first need to select another window or application, then select the new window again. Now the new selection will be reported correctly.

2- When one of the effects in the figure below is applied to an image, and then another image is selected, the Image Edit Panel doesn't reset the filter and it is added to the new image, even if it is not visible in the Quick Print window. However, when you try to print the new selected image, the previous effect will be applied to it.

Workaround:

To eliminate the filter you need to open the Image Edit Panel again and click on the “Current” filter. This way, you’ll be able to print the image in the original format.
